Rome, July 2nd, 2023

# Outline

1. Motivation
2. Absorption Theory
3. Anti-Unification Algorithm for absorption theory
4. Conclusions and Future work

# Motivation

## Unification

Goal: find a substitution that identifies two expressions (terms).

where  $t\sigma \approx r' \approx s\sigma$ .

## Example 1

Identify the terms  $h(g(a), y)$  and  $h(g(z), f(w))$ . Using the substitution  $\sigma = \{y \mapsto f(w), z \mapsto a\}$  the expressions *unify* to  $h(g(a), b)$ .

## Anti-unification

Goal: find the commonalities between two expressions (terms).

An expression with such commonalities is called a *generalization*.

where  $r\sigma \approx s$  and  $r\rho \approx t$ .

## Example 2

Generalize the terms  $h(g(a), y)$  and  $h(g(z), f(w))$ .

## Anti-unification

Goal: find the commonalities between two expressions (terms).  
An expression with such commonalities is called a *generalization*.

where  $r\sigma \approx s$  and  $r\rho \approx t$ .

## Example 2

Generalize the terms  $h(g(a), y)$  and  $h(g(z), f(w))$ .

generalization:  $h(g(u), v)$ , with substitutions  $\sigma = \{u \mapsto a, v \mapsto y\}$  and  $\rho = \{u \mapsto z, v \mapsto f(w)\}$ .

# Unification and Anti-unification

# Motivation

One interesting example of verbatim plagiarism:

- (Original sentence). All around the world, technology is continuing to become a part of everyday life, and its capabilities are progressing rapidly.
- (Possibly sentence with plagiarism). All over the world, technology became a part of our lives, and its capabilities are progressing very quickly.

# Motivation

Then finding the common parts and the differences in the sentences:

- All **around** the world, technology **is continuing to become** a part of **everyday life** , and its capabilities are progressing **rapidly** .
- All **over** the world, technology **became** a part of **our lives** , and its capabilities are progressing **very quickly** .

All  the world, technology  a part of  , and its capabilities are progressing  .

# Motivation

Applications of anti-unification include:

- searching parallel recursion schemes to transform sequential algorithms into parallel algorithms (Barwell et al. [BBH18]);
- preventing bugs and misconfigurations in software (Mehta et al. [MBK<sup>+</sup>20]);
- finding duplicate code and similarities;
- detecting code clones (i.e., plagiarism).

# Absorption Theory

- The alphabet consists of a countable set of variables  $\mathcal{V}$  and set  $\mathcal{F}$  of function and with a special constant symbol  $\star$  (The wild card).
- Terms over this alphabet,  $\mathcal{T}(\mathcal{F}, \mathcal{V})(\mathcal{T})$  and  $\mathcal{T}(\mathcal{F} \cup \{\star\}, \mathcal{V})(\mathcal{T}_\star)$ , defined as usually:

$$t := x \mid f(t_1, \dots, t_n)$$

- A finite set  $E$  that consists of equations  $s \approx t$ .
- A preorder  $\preceq_E$ , which states that  $s \preceq_E t$  if there exists a substitution  $\sigma$  such that  $s\sigma \approx_E t$ .

# Absorption Theory

## Type of anti-unification problems

The type of an anti-unification modulo  $E$  problem is classified as below.

- *Nullary*(0): if there are terms  $s$  and  $t$  such that  $\text{mcs}_{g_E}(s, t)$  does not exist. Also, called *type zero*.
- *Unitary*(1): if for all  $s$  and  $t$ ,  $\text{mcs}_{g_E}(s, t)$  has just one generalization.
- *Finitary*( $\omega$ ): if for all  $s$  and  $t$ ,  $\text{mcs}_{g_E}(s, t)$  has more than one generalization.
- *Infinitary*( $\infty$ ): there are terms  $s$  and  $t$  such that  $\text{mcs}_{g_E}(s, t)$  is infinite.

# Absorption Theory

- An *anti-unification equation* (AUE) between  $s$  and  $t$  in a normal form is denoted by  $s \stackrel{x}{\triangle}_E t$ , where  $x$  is called as label.
- A *valid set of AUEs* is a set of AUEs where all the labels are different.
- An AUE  $s \stackrel{x}{\triangle} t$  is *solved* if  $head(s)$  and  $head(t)$  are not related absorption symbols, where  $s, t \in \mathcal{T}$ .
- An AUE  $s \stackrel{x}{\triangle} t$  is *wild* if one of the terms is the wild card and the other belongs to  $\mathcal{T}$ .

# Absorption Theory

## Absorption Theory

Absorption is an important algebraic attribute in some magmas: for some function symbol  $f$  there is a constant  $\varepsilon_f$  such that

$$f(x, \varepsilon_f) \approx \varepsilon_f, \text{ or/and } f(\varepsilon_f, x) \approx \varepsilon_f$$

Equational theories with these equations are called an absorption theories (Abs).

## Example 3

Let's find one generalization of the AUE  $\varepsilon_f \stackrel{\Delta}{=}_{\text{Abs}} f(f(a, b), c)$ .

# Anti-Unification Algorithm for Absorption Theory

The idea of the algorithm is to expand the  $\varepsilon_f$  to get the generalization:

$$\begin{array}{l|l}
 \varepsilon_f \stackrel{x}{\triangleq} f(f(a, b), c) & x \\
 f(\varepsilon_f, c) \stackrel{x}{\triangleq} f(f(a, b), c) & x \\
 \varepsilon_f \stackrel{y}{\triangleq} f(a, b), c \stackrel{z}{\triangleq} c & f(y, z) \\
 f(\varepsilon_f, b) \stackrel{y}{\triangleq} f(a, b) & f(y, c) \\
 \varepsilon_f \stackrel{u}{\triangleq} a, b \stackrel{v}{\triangleq} b & f(f(u, v), c) \\
 \varepsilon_f \stackrel{u}{\triangleq} a & f(f(u, b), c)
 \end{array}$$

# Anti-Unification Algorithm for Absorption Theory

## Algorithm for absorption theory

To build the algorithm we consider a quadruple  $\langle A; S; T; \theta \rangle$  as a *configuration* in each step of the procedure, where:

- $A$  is the valid set of *unsolved* AUEs;
- $S$  is the *store*, the valid set of *solved* AUEs;
- $T$  is the *abstraction*, the valid set of wild AUEs;
- $\theta$  is a *substitution* mapping the labels of the AUEs to the term of the generalization given by the rules.

# Anti-Unification Algorithm for Absorption Theory

## Inference Rules

Then we define the next rules

(Dec): **Decompose**

$$\begin{aligned} & \langle \{f(s_1, \dots, s_n) \stackrel{x}{\triangle} f(t_1, \dots, t_n)\} \sqcup A; S; \theta \rangle \\ \xRightarrow{Dec} & \langle \{s_1 \stackrel{y_1}{\triangle} t_1, \dots, s_n \stackrel{y_n}{\triangle} t_n\} \cup A; S; \theta \{x \mapsto f(y_1, \dots, y_n)\} \rangle \end{aligned}$$

For  $f$  any function symbol,  $n > 0$ , and  $y_1, \dots, y_n$  are fresh variables.

# Anti-Unification Algorithm for Absorption Theory

## Inference Rules

(Solve): **Solve**

$$\langle \{s \stackrel{x}{\triangle} t\} \sqcup A; S; T; \theta \rangle \xrightarrow{Sol} \langle A; \{s \stackrel{x}{\triangle} t\} \cup S; T; \theta \rangle$$

Where  $head(s) \neq head(t)$  are not related absorption symbols.

(Mer): **Merge**

$$\langle \emptyset; \{s \stackrel{x}{\triangle} t\} \cup \{s \stackrel{y}{\triangle} t\} \cup S; \theta \rangle \xrightarrow{Mer} \langle \emptyset; \{s \stackrel{y}{\triangle} t\} \cup S; \theta\{x \mapsto y\} \rangle$$

# Anti-Unification Algorithm for Absorption Theory

## Inference Rules

(ExpLA1): **Expansion for Absorption, Left 1**

$$\begin{aligned} & \langle \{ \varepsilon_f \stackrel{x}{\triangle} f(t_1, t_2) \} \sqcup A; S; T; \theta \rangle \\ \xrightarrow{\text{ExpLA1}} & \langle \{ \varepsilon_f \stackrel{y_1}{\triangle} t_1 \} \cup A; S; \{ \star \stackrel{y_2}{\triangle} t_2 \} \cup T; \theta \{ x \mapsto f(y_1, y_2) \} \rangle \end{aligned}$$

(ExpLA2): **Expansion for Absorption, Left 2**

$$\begin{aligned} & \langle \{ \varepsilon_f \stackrel{x}{\triangle} f(t_1, t_2) \} \sqcup A; S; T; \theta \rangle \\ \xrightarrow{\text{ExpLA2}} & \langle \{ \varepsilon_f \stackrel{y_2}{\triangle} t_2 \} \cup A; S; \{ \star \stackrel{y_1}{\triangle} t_1 \} \cup T; \theta \{ x \mapsto f(y_1, y_2) \} \rangle \end{aligned}$$

# Anti-Unification Algorithm for Absorption Theory

## Inference Rules

(ExpRA1): **Expansion for Absorption, Right 1**

$$\begin{array}{c} \langle \{f(s_1, s_2) \stackrel{x}{\triangle} \varepsilon_f\} \sqcup A; S; T; \theta \rangle \\ \xrightarrow{\text{ExpRA1}} \langle \{s_1 \stackrel{y_1}{\triangle} \varepsilon_f\} \cup A; S; \{s_2 \stackrel{y_2}{\triangle} \star\} \cup T; \theta\{x \mapsto f(y_1, y_2)\} \rangle \end{array}$$

(ExpRA2): **Expansion for Absorption, Right 2**

$$\begin{array}{c} \langle \{f(s_1, s_2) \stackrel{x}{\triangle} \varepsilon_f\} \sqcup A; S; T; \theta \rangle \\ \xrightarrow{\text{ExpRA2}} \langle \{s_2 \stackrel{y_2}{\triangle} \varepsilon_f\} \cup A; S; \{s_1 \stackrel{y_1}{\triangle} \star\} \cup T; \theta\{x \mapsto f(y_1, y_2)\} \rangle \end{array}$$

# Algorithm ANT\_UNIF

## Algorithm ANT\_UNIF

The algorithm ANT\_UNIF is an exhaustive application of the inference rules to transform an *initial configuration*  $\langle A; \emptyset; \emptyset; \iota \rangle$  into a set of final configurations with an empty set of unsolved AUEs of the form  $\langle \emptyset, S, T, \theta \rangle$  and there are no different AUEs with the same terms  $s, t$  and with a different label.

## Example 4

Apply ANT\_UNIF to the anti-unification problem  $g(\varepsilon_f, a) \triangleq g(f(h(\varepsilon_f), a), \varepsilon_f)$ .

# Algorithm ANT\_UNIF

$$\begin{aligned}
 & \langle \{g(\varepsilon_f, a) \stackrel{x}{\triangleq} g(f(h(\varepsilon_f), a), \varepsilon_f)\}; \emptyset; \emptyset; \iota \rangle \xrightarrow{Dec} \\
 & \langle \{\varepsilon_f \stackrel{w_1}{\triangleq} f(h(\varepsilon_f), a), a \stackrel{w_2}{\triangleq} \varepsilon_f\}; \emptyset; \emptyset; \{x \mapsto g(w_1, w_2)\} \rangle \xrightarrow{ExpLA2} \\
 & \langle \{\varepsilon_f \stackrel{u_2}{\triangleq} a, a \stackrel{w_2}{\triangleq} \varepsilon_f\}; \emptyset; \{\star \stackrel{u_1}{\triangleq} h(\varepsilon_f)\}; \{x \mapsto g(f(u_1, u_2), w_2)\} \rangle \xrightarrow{Sol} \\
 & \langle \{\varepsilon_f \stackrel{u_2}{\triangleq} a\}; \{a \stackrel{w_2}{\triangleq} \varepsilon_f\}; \{\star \stackrel{u_1}{\triangleq} h(\varepsilon_f)\}; \{x \mapsto g(f(u_1, u_2), w_2)\} \rangle \xrightarrow{Sol} \\
 & \langle \emptyset; \{\varepsilon_f \stackrel{u_2}{\triangleq} a, a \stackrel{w_2}{\triangleq} \varepsilon_f\}; \{\star \stackrel{u_1}{\triangleq} h(\varepsilon_f)\}; \{x \mapsto g(f(u_1, u_2), w_2)\} \rangle
 \end{aligned}$$

# Algorithm ANT\_UNIF

Then,  $g(f(u_1, u_2), w_2)$  is a generalization with the substitutions  $\sigma$  and  $\rho$ .

# Abstraction Set

## Abstraction Set

Let  $t$  be a term in Abs-normal form, and  $\sigma$  be a substitution with images in Abs-normal form. The abstraction of  $t$  with respect to  $\sigma$  is the set:

$$\uparrow(t, \sigma) := \{r \mid r\sigma \approx_{\text{Abs}} t, r \text{ is an Abs-normal form, and } \text{Var}(r) \subseteq \text{Dom}(\sigma)\}$$

# Algorithm ANT\_UNIF

## Example 5

Find the abstraction set of  $h(\varepsilon_f)$  with respect to  $\rho = \{u_2 \mapsto a, w_2 \mapsto \varepsilon_f\}$ :

$$\uparrow (h(\varepsilon_f), \rho) = \{h(\varepsilon_f), h(w_2), h(f(w_2, \star)), h(f(\star, w_2)), h(f(u_2, w_2)), \dots\}$$

Where  $\star$  could be replaced by a term whose variables are included in  $Dom(\rho)$ . For example,  $h(f(w_2, a))$  and  $h(f(w_2, h(g(u_2, w_2))))$  belong to the abstraction set.

# Algorithm ANT\_UNIF

Continue with Example 4:

$$(\varepsilon_f, a) \triangleq g(f(h(\varepsilon_f), a), \varepsilon_f)$$

The final branch:

$$\langle \emptyset; \{\varepsilon_f \stackrel{u_2}{\triangleq} a, a \stackrel{w_2}{\triangleq} \varepsilon_f\}; \{\star \stackrel{u_1}{\triangleq} h(\varepsilon_f)\}; \{x \mapsto g(f(u_1, u_2), w_2)\} \rangle$$

To find a less general generalization, it is possible to replace the variable  $u_1$  in the generalization  $g(f(u_1, u_2), w_2)$  for one of the elements of the abstraction set  $\uparrow (h(\varepsilon_f), \rho)$ .

# Algorithm ANT\_UNIF

Then, the term  $g(f(h(f(w_2, a)), u_2), w_2)$  is a generalization too.

# Algorithm for ANT\_UNIF

## Termination

The procedure ANT\_UNIF is terminating. Particularly, for any configuration  $\langle A; S; T; \theta \rangle$ , it outputs a finite set of configurations of the form  $\langle \emptyset; S'; T'; \theta' \rangle$ .

# Algorithm for ANT\_UNIF

## Soundness

If  $\langle A_0; S_0; T_0; \theta_0 \rangle \Longrightarrow^* \langle \emptyset; S_n; T_n; \theta_n \rangle$  is a derivation to a final configuration, then for each  $s \stackrel{x}{\Delta} t \in A_0 \cup S_0 \cup T_0$ :

- $x\theta_n$  is a generalization of  $s$  and  $t$ , and  $x\theta_n\sigma_{\mathcal{D}} \approx_{\text{Abs}} s$  and
- $x\theta_n\rho_{\mathcal{D}} \approx_{\text{Abs}} t$ .

# Conclusions and Future work

- We design an algorithm for anti-unification in absorption theories.  
The algorithm is terminating and sound.
- We conjecture that the algorithm is complete.  
The complete set of least general generalizers can be built from the computed substitutions, the store, and the *abstraction set*.
