A temporal semantics for Nilpotent Minimum logic

Matteo Bianchi Università degli Studi di Milano matteo.bianchi@unimi.it

・ロト ・回ト ・ヨト

• Nilpotent Minimum logic (NM) was introduced in [EG01] as the logical counterpart of the algebraic variety induced by Nilpotent Minimum t-norm

イロト イロト イヨト イ

- Nilpotent Minimum logic (NM) was introduced in [EG01] as the logical counterpart of the algebraic variety induced by Nilpotent Minimum t-norm
- In this talk, we present a temporal like semantics for NM, in which the temporal flow is given by any infinite totally ordered set, and the logic in every instant is given by Łukasiewicz three valued logic.

- Nilpotent Minimum logic (NM) was introduced in [EG01] as the logical counterpart of the algebraic variety induced by Nilpotent Minimum t-norm
- In this talk, we present a temporal like semantics for NM, in which the temporal flow is given by any infinite totally ordered set, and the logic in every instant is given by Łukasiewicz three valued logic.
- This work prosecute the research line in temporal semantics started in [AGM08, ABM09] for BL and Gödel logics.

- This work prosecute the research line in temporal semantics started in [AGM08, ABM09] for BL and Gödel logics.
- We conclude by presenting a completeness theorem.

< □ > < 同 > < 回 > < Ξ > < Ξ

 Monoidal t-norm based logic (MTL) was introduced in [EG01]: it is based over connectives &, ∧, →, ⊥ (the first three are binary, whilst the last one is 0-ary).

・ロト ・回ト ・ヨト ・

- Monoidal t-norm based logic (MTL) was introduced in [EG01]: it is based over connectives &, ∧, →, ⊥ (the first three are binary, whilst the last one is 0-ary).
- The notion of formula is defined inductively starting from the fact that all propositional variables (we will denote their set with VAR) and \perp are formulas. The set of all formulas will be called *FORM*.

• • • • • • • • • • • • •

- Monoidal t-norm based logic (MTL) was introduced in [EG01]: it is based over connectives &, ∧, →, ⊥ (the first three are binary, whilst the last one is 0-ary).
- The notion of formula is defined inductively starting from the fact that all propositional variables (we will denote their set with VAR) and \perp are formulas. The set of all formulas will be called *FORM*.
- Useful derived connectives are the following

$$\begin{array}{ll} \text{(negation)} & \neg \varphi := \varphi \to \bot \\ \text{(disjunction)} & \varphi \lor \psi := ((\varphi \to \psi) \to \psi) \land ((\psi \to \varphi) \to \varphi) \end{array}$$

Syntax

(A1)
$$(\varphi \to \psi) \to ((\psi \to \chi) \to (\varphi \to \chi))$$

(A2)
$$(\varphi \& \psi) \to \varphi$$

(A3)
$$(\varphi \& \psi) \to (\psi \& \varphi)$$

$$(A4) \qquad \qquad (\varphi \land \psi) \to \varphi$$

(A5)
$$(\varphi \wedge \psi) \rightarrow (\psi \wedge \varphi)$$

(A6)
$$(\varphi \& (\varphi \to \psi)) \to (\psi \land \varphi)$$

(A7a)
$$(\varphi \to (\psi \to \chi)) \to ((\varphi \& \psi) \to \chi)$$

(A7b)
$$((\varphi \& \psi) \to \chi) \to (\varphi \to (\psi \to \chi))$$

(A8)
$$((\varphi \to \psi) \to \chi) \to (((\psi \to \varphi) \to \chi) \to \chi)$$

 $(A9) \qquad \qquad \bot \to \varphi$

As inference rule we have modus ponens:

$$(\mathsf{MP}) \qquad \qquad \frac{\varphi \quad \varphi \to \psi}{\psi}$$

イロト イロト イヨト イヨ

Nilpotent Minimum Logic (NM), introduced in [EG01] is obtained from MTL by adding the following axioms:

 $\begin{array}{ll} \text{(involution)} & \neg \neg \varphi \rightarrow \varphi \\ \text{(WNM)} & \neg (\varphi \& \psi) \lor ((\varphi \land \psi) \rightarrow (\varphi \& \psi)) \end{array}$

The notions of theory, syntactic consequence, proof are defined as usual.

An MTL algebra is an algebraic structure $\langle A, *, \Rightarrow, \sqcap, \sqcup, 0, 1 \rangle$ such that

- **(** $A, \Box, \sqcup, 0, 1$) is a bounded lattice with bottom 0 and top 1.
- **2** $\langle A, *, 1 \rangle$ is a commutative monoid.
- **③** $\langle *, \Rightarrow \rangle$ forms a *residuated pair*: $z * x \le y$ iff $z \le x \Rightarrow y$ for all $x, y, z \in A$.
- The following axiom hold, for all $x, y \in A$:

(Prelinearity)
$$(x \Rightarrow y) \sqcup (y \Rightarrow x) = 1$$

A totally ordered MTL-algebra is called MTL-chain.

• An NM-algebra is an MTL-algebra that satisfies the following equations:

$$\sim \sim x = x$$

$$\sim (x * y) \sqcup ((x \sqcap y) \Rightarrow (x * y)) = 1$$

Where $\sim x$ indicates $x \Rightarrow 0$.

As pointed in [Gis03], in each NM-chain it holds that:

$$x * y = \begin{cases} 0 & \text{if } x \le n(y) \\ \min(x, y) & \text{Otherwise.} \end{cases}$$
$$x \Rightarrow y = \begin{cases} 1 & \text{if } x \le y \\ \max(n(x), y) & \text{Otherwise.} \end{cases}$$

• Where *n* is a strong negation function, i.e. $n : A \to A$ is an order-reversing mapping $(x \le y \text{ implies } n(x) \ge n(y))$ such that n(0) = 1 and n(n(x)) = x, for each $x \in A$. Observe that $n(x) = x \Rightarrow 0$, for each $x \in A$.

<ロト <四ト < 回ト < 回 > < 回

As pointed in [Gis03], in each NM-chain it holds that:

$$x * y = \begin{cases} 0 & \text{if } x \le n(y) \\ \min(x, y) & \text{Otherwise.} \end{cases}$$
$$x \Rightarrow y = \begin{cases} 1 & \text{if } x \le y \\ \max(n(x), y) & \text{Otherwise.} \end{cases}$$

- Where *n* is a strong negation function, i.e. $n : A \to A$ is an order-reversing mapping $(x \le y \text{ implies } n(x) \ge n(y))$ such that n(0) = 1 and n(n(x)) = x, for each $x \in A$. Observe that $n(x) = x \Rightarrow 0$, for each $x \in A$.
- A negation fixpoint is an element x ∈ A such that n(x) = x: note that if exists then it must be unique (otherwise n fails to be order-reversing).

イロト イヨト イヨト イヨト

Let \mathcal{A} be an NM-algebra. Each map $e: VAR \to A$ extends uniquely to an \mathcal{A} -assignment $v_e: FORM \to A$ in the usual violative way

イロト イロト イヨト イ

Let \mathcal{A} be an NM-algebra. Each map $e: VAR \to A$ extends uniquely to an \mathcal{A} -assignment $v_e: FORM \to A$ in the usual value way

A formula φ is consequence of a theory (i.e. set of formulas) Γ in an NM-algebra A, in symbols, Γ ⊨_A φ, if for each A-assignment v, v(ψ) = 1 for all ψ ∈ Γ implies that v(φ) = 1.

イロト イヨト イヨト イ

Let \mathcal{A} be an NM-algebra. Each map $e: VAR \to A$ extends uniquely to an \mathcal{A} -assignment $v_e: FORM \to A$ in the usual value way

- A formula φ is consequence of a theory (i.e. set of formulas) Γ in an NM-algebra A, in symbols, Γ ⊨_A φ, if for each A-assignment v, v(ψ) = 1 for all ψ ∈ Γ implies that v(φ) = 1.
- Let \mathcal{A} be an NM-chain. We say that NM is strongly complete (respectively: finitely strongly complete, complete) with respect to \mathcal{A} if for every theory Γ (respectively, for every finite theory Γ of formulas, for $\Gamma = \emptyset$) and for every formula φ we have

$$\Gamma \vdash_{\mathsf{NM}} \varphi$$
 iff $\Gamma \models_{\mathcal{A}} \varphi$

Let \mathcal{A} be an NM-algebra. Each map $e: VAR \to A$ extends uniquely to an \mathcal{A} -assignment $v_e: FORM \to A$ in the usual value way

- A formula φ is consequence of a theory (i.e. set of formulas) Γ in an NM-algebra A, in symbols, Γ ⊨_A φ, if for each A-assignment v, v(ψ) = 1 for all ψ ∈ Γ implies that v(φ) = 1.
- Let \mathcal{A} be an NM-chain. We say that NM is strongly complete (respectively: finitely strongly complete, complete) with respect to \mathcal{A} if for every theory Γ (respectively, for every finite theory Γ of formulas, for $\Gamma = \emptyset$) and for every formula φ we have

$$\Gamma \vdash_{\mathsf{NM}} \varphi \quad \text{iff} \quad \Gamma \models_{\mathcal{A}} \varphi$$

Theorem 2

NM is finitely strongly complete w.r.t. every infinite NM-chain with negation fixpoint.

- The logic associated to the single instant is based over three truth-values, $\{0, \frac{1}{2}, 1\}$, ordered in the way that $0 < \frac{1}{2} < 1$.
- Over these three values we can define the semantics associated to a negation and an implication operations:

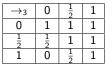

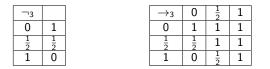

Image: A math a math

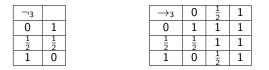

- A temporal flow is an arbitrary totally ordered infinite set (*T*, ≤): the elements of *T* are called *instants*.
- The logic associated to the single instant is based over three truth-values, $\{0, \frac{1}{2}, 1\}$, ordered in the way that $0 < \frac{1}{2} < 1$.
- Over these three values we can define the semantics associated to a negation and an implication operations:

• In the proposed semantics a temporal assignment (over a temporal flow $\langle T, \leq \rangle$) is a function $v : FORM \times T \rightarrow \{0, \frac{1}{2}, 1\}$.

(日) (同) (三) (三) (三)

- A temporal flow is an arbitrary totally ordered infinite set (*T*, ≤): the elements of *T* are called *instants*.
- The logic associated to the single instant is based over three truth-values, $\{0, \frac{1}{2}, 1\}$, ordered in the way that $0 < \frac{1}{2} < 1$.
- Over these three values we can define the semantics associated to a negation and an implication operations:

- In the proposed semantics a temporal assignment (over a temporal flow ⟨T, ≤⟩) is a function v : FORM × T → {0, ¹/₂, 1}.
- However, not arbitrary assignments are admitted: in our semantics $v(\varphi, \cdot)$ must behaves as follows:

イロト イポト イヨト イヨト

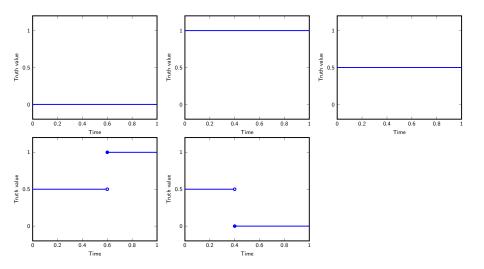

Image: A matching of the second se

Condition 2.1

We restrict to the following types of temporal assignments v: FORM \times T \rightarrow {0, $\frac{1}{2}$, 1}, for every $\varphi \in$ FORM:

- $v(\varphi, \cdot)$ is constant, to 0, $\frac{1}{2}$ or 1. In this case we say that, respectively $v(\varphi, \cdot) \approx 0$, $v(\varphi, \cdot) \approx \frac{1}{2}$, $v(\varphi, \cdot) \approx 1$.
- **2** There is a $t \in T$, with $t \neq \min(T)$ (if T has a minimum) such that

$$v(arphi,t')=0$$
 for every $t'\geq t, ext{ and } v(arphi,t'')=rac{1}{2}, ext{ for every } t''< t.$

In this case we say that $v(\varphi, \cdot) \approx t_0$.

③ There is a $t \in T$, with $t \neq \min(T)$ (if T has a minimum) such that

$$v(\varphi,t') = 1$$
 for every $t' \ge t$, and $v(\varphi,t'') = \frac{1}{2}$, for every $t'' < t$.

In this case we say that $v(\varphi, \cdot) \approx t_1$.

Temporal semantics, a comparison with the case of Gödel logic

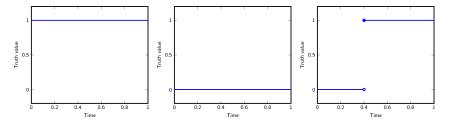

Image: Image:

Now we introduce the definition of temporal assignment (first on the variables, and then we will extend it over formulas):

Definition 4

A temporal assignment over variables (associated to a temporal flow $\langle T, \leq \rangle$) is a function $v : VAR \times T \rightarrow \{0, \frac{1}{2}, 1\}$ such that one of the following holds, for every $x \in VAR$:

- $v(x, \cdot)$ is constant.
- There is a $t \in T$, with $t \neq \min(T)$ (if T has a minimum) such that

$$v(\varphi,t') = 0$$
 for every $t' \ge t$, and $v(\varphi,t'') = \frac{1}{2}$, for every $t'' < t$.

• There is a $t \in T$, with $t \neq \min(T)$ (if T has a minimum) such that

$$v(\varphi,t') = 1$$
 for every $t' \geq t$, and $v(\varphi,t'') = \frac{1}{2}$, for every $t'' < t$.

(日) (同) (三) (三) (三)

We now extend our notion of temporal assignments to the formulas of Nilpotent Minimum logic.

・ロト ・回ト ・ヨト

We now extend our notion of temporal assignments to the formulas of Nilpotent Minimum logic.

Remark 2.1

We will consider only \rightarrow , \neg , as connectives. This is because, as pointed out in [EGCN03], in Nilpotent Minimum logic the disjunction \lor is definable from \neg , \rightarrow .

Image: A math a math

Let v be a temporal assignment over variables, associated to some temporal flow T. Its extension $v': FORM \times T \rightarrow \{0, \frac{1}{2}, 1\}$ to formulas is defined, inductively, in the following way, for every $\varphi \in FORM$, and $t \in T$:

$$\mathbf{v}'(arphi,t) \coloneqq egin{cases} \mathbf{v}(x,t) & ext{if } arphi = x \ 0 & ext{if } arphi = oldsymbol{arphi} \
ext{--} \mathbf{v}'(\psi,t) & ext{if } arphi =
ext{--} \psi \
ext{v}'_d(\psi o \chi,t) & ext{if } arphi = \psi o \chi \end{cases}$$

Where $\psi, \chi \in FORM$, $x \in VAR$ and

$$v'_{d}(\psi \to \chi, t) := \begin{cases} v'(\psi, t) \to_{3} v'(\chi, t) & \text{if } v'(\psi, t) \to_{3} v'(\chi, t) = v'(\psi, t') \to_{3} v'(\chi, t'), \\ & \text{for every } t' \ge t \\ \frac{1}{2} & \text{otherwise.} \end{cases}$$

- Essentially, we are applying the "three-valued" operations in a "pointwise" way, that is instant by instant
- The function v_d associates to an assignment v its "definitive behavior": this function is necessary to restrict ourself on the assignments of Condition 2.1, as the following proposition shows.

Lemma 6

The temporal assignments previously defined satisfy Condition 2.1.

Definition 7 (consequence)

Let $\langle T, \leq \rangle$ be a temporal assignment, Γ a theory, and φ a formula. With

$$\Box \models_{\mathcal{T}} \varphi$$

we mean that for every temporal assignment w such that $w(\psi, t) = 1$, for every $\psi \in \Gamma$, $t \in T$ it holds that $w(\varphi, t) = 1$, for every $t \in T$.

Theorem 8 (Completeness theorem)

Let $\langle T, \leq \rangle$ be a temporal flow. Then for each formula φ and finite theory Γ

 $\Gamma \vdash_{NM} \varphi \quad iff \quad \Gamma \models_T \varphi.$

・ロト ・回ト ・ヨト ・ヨト

Theorem 8 (Completeness theorem)

Let $\langle T, \leq \rangle$ be a temporal flow. Then for each formula φ and finite theory Γ

 $\Gamma \vdash_{NM} \varphi$ iff $\Gamma \models_T \varphi$.

Example 2.1

Let $\langle T, \leq \rangle = \langle \mathbb{N}, \geq_{\mathbb{N}} \rangle$: it follows that $\mathcal{A}_T \simeq NM_{\infty}$. We have that, for each formula φ and each finite theory Γ :

$$\Gamma \vdash_{NM} \varphi$$
 iff $\Gamma \models_{\mathcal{A}_T} \varphi$.

Consider now $\langle T, \leq \rangle \in \{ \langle \mathbb{R}, \leq_{\mathbb{R}} \rangle, \langle \mathbb{Q}, \leq_{\mathbb{Q}} \rangle \}$: it follows that $\mathcal{A}_T \simeq [0, 1]_{NM}$ or $\mathcal{A}_T \simeq [0, 1]_{NM}^{\mathbb{Q}}$. It can be show that for each formula φ and theory Γ :

$$\Gamma \vdash_{NM} \varphi$$
 iff $\Gamma \models_T \varphi$.

・ロト ・回ト ・ヨト ・ヨト

The basic idea is to show that every temporal flow ⟨T, ≤⟩ can induce an algebraic structure ⟨T', ≤'⟩ that is isomorphic to an infinite NM-chain with negation fixpoint.

Image: A math a math

- The basic idea is to show that every temporal flow ⟨T, ≤⟩ can ▶ induce an algebraic structure ⟨T', ≤'⟩ that is isomorphic to an infinite NM-chain with negation fixpoint.
- Viceversa, from the lattice reduct of an NM-chain with negation fixpoint A, we can
 obtain an algebraic structure of the form ⟨T', ≤'⟩, isomorphic to A associated to
 some temporal flow ⟨T, ≤⟩.

- The basic idea is to show that every temporal flow ⟨T, ≤⟩ can light induce an algebraic structure ⟨T', ≤'⟩ that is isomorphic to an infinite NM-chain with negation fixpoint.
- Viceversa, from the lattice reduct of an NM-chain with negation fixpoint A, we can
 obtain an algebraic structure of the form ⟨T', ≤'⟩, isomorphic to A associated to
 some temporal flow ⟨T, ≤⟩.
- The main point is that we can find a bijection between the assignments over (*T*, ≤) and (*T'*, ≤'), preserving the validity. That is, for every theory Γ, and formula φ

$$\Gamma \models_{\langle T, \leq \rangle} \varphi$$
 iff $\Gamma \models_{\langle T', \leq' \rangle} \varphi$.

- The basic idea is to show that every temporal flow ⟨T, ≤⟩ can light induce an algebraic structure ⟨T', ≤'⟩ that is isomorphic to an infinite NM-chain with negation fixpoint.
- Viceversa, from the lattice reduct of an NM-chain with negation fixpoint A, we can
 obtain an algebraic structure of the form ⟨T', ≤'⟩, isomorphic to A associated to
 some temporal flow ⟨T, ≤⟩.
- The main point is that we can find a bijection between the assignments over ⟨T, ≤⟩ and ⟨T', ≤'⟩, preserving the validity. That is, for every theory Γ, and formula φ

$$\mathsf{\Gamma}\models_{\langle \mathcal{T},\leq\rangle}\varphi \qquad \text{iff}\qquad \mathsf{\Gamma}\models_{\langle \mathcal{T}',\leq'\rangle}\varphi.$$

• Since NM enjoys the finite strong completeness w.r.t. every NM-chain with negation fixpoint, we obtain the completeness theorem w.r.t. our temporal semantics.

イロト イポト イヨト イヨ

- The basic idea is to show that every temporal flow ⟨T, ≤⟩ can ^{linduce} an algebraic structure ⟨T', ≤'⟩ that is isomorphic to an infinite NM-chain with negation fixpoint.
- Viceversa, from the lattice reduct of an NM-chain with negation fixpoint A, we can
 obtain an algebraic structure of the form ⟨T', ≤'⟩, isomorphic to A associated to
 some temporal flow ⟨T, ≤⟩.
- The main point is that we can find a bijection between the assignments over ⟨T, ≤⟩ and ⟨T', ≤'⟩, preserving the validity. That is, for every theory Γ, and formula φ

$$\mathsf{\Gamma}\models_{\langle \mathcal{T},\leq\rangle}\varphi \qquad \text{iff}\qquad \mathsf{\Gamma}\models_{\langle \mathcal{T}',\leq'\rangle}\varphi.$$

- Since NM enjoys the finite strong completeness w.r.t. every NM-chain with negation fixpoint, we obtain the completeness theorem w.r.t. our temporal semantics.
- The fact that NM enjoys the strong completeness w.r.t. the temporal flows $\langle \mathbb{R}, \leq_{\mathbb{R}} \rangle$ and $\langle \mathbb{Q}, \leq_{\mathbb{Q}} \rangle$ is essentially due to the strong completeness theorem of NM w.r.t. $[0,1]_{NM}$, and $[0,1]_{NM}^{\mathbb{Q}}$.

APPENDIX

メロト メロト メヨト メ

Let \mathcal{A} be an NM-algebra. Each map $e: VAR \to A$ extends uniquely to an \mathcal{A} -assignment $v_e: FORM \to A$, by the following inductive prescriptions:

•
$$v_e(\perp) = 0$$

•
$$v_e(\varphi \rightarrow \psi) = v_e(\varphi) \Rightarrow v_e(\psi)$$

•
$$v_e(\varphi \& \psi) = v_e(\varphi) * v_e(\psi)$$

•
$$v_e(\varphi \land \psi) = v_e(\varphi) \sqcap v_e(\psi)$$

◀ back

イロト イヨト イヨト

Let \mathcal{A} be an NM-chain. We say that NM is strongly complete (respectively: finitely strongly complete, complete) with respect to \mathcal{A} if for every theory Γ (respectively, for every finite theory Γ of formulas, for $\Gamma = \emptyset$) and for every formula φ we have

$$\Gamma \vdash_{\mathsf{NM}} \varphi \quad \text{iff} \quad \Gamma \models_{\mathcal{A}} \varphi$$

Theorem 10 ([EG01, Gis03])

Let A be an infinite NM-chain with negation fixpoint. Then NM is complete w.r.t. A.

This result can be improved:

Theorem 11

Let \mathcal{A} be an infinite NM-chain with negation fixpoint. Then NM is finitely strongly complete w.r.t. \mathcal{A} .

< ロ > < 同 > < 三 > < 三

▲ back

Note that, by analyzing the question from a different perspective, a temporal assignment is a function that associates to every formula a certain sequence (indexed by the instants of time) of truth-values:

Definition 12

Given a temporal assignment v (over a temporal flow $\langle T, \leq \rangle$), one can define a function \cdot^{v} from the set of formulas into the set of sequences of $\{0, \frac{1}{2}, 1\}^{T}$ by

$$\varphi^{\mathsf{v}} := \mathsf{v}(\varphi, \cdot).$$

We set $\mathcal{T}_{\mathcal{T}} = \{\varphi^{\mathsf{v}} : \varphi \text{ is a formula and } \mathsf{v} \text{ is a temporal assignment over } \langle \mathcal{T}, \leq \rangle\}.$

Since we are interested in the definitive behavior of a temporal assignment, we now define an operator that "capture" the behavior of an assignment.

イロト イポト イヨト イヨト

Let φ, v be a formula and a temporal assignment over a temporal flow $\langle T, \leq \rangle$, and let $T' = T \cup \{-\infty\}$. The definitive behavior operator $d : \mathcal{T}_T \to T' \times \{0, \frac{1}{2}, 1\}$ is defined as follows:

The fact that d is a well defined map is assured by Theorem 6.

メロト メロト メヨト メ

Let φ, v be a formula and a temporal assignment over a temporal flow $\langle T, \leq \rangle$, and let $T' = T \cup \{-\infty\}$. The definitive behavior operator $d : \mathcal{T}_T \to T' \times \{0, \frac{1}{2}, 1\}$ is defined as follows:

• $d(\varphi^{\nu}) = \langle -\infty, 1 \rangle$ if $\varphi^{\nu} \approx 1$.

The fact that d is a well defined map is assured by Theorem 6.

Let φ, v be a formula and a temporal assignment over a temporal flow $\langle T, \leq \rangle$, and let $T' = T \cup \{-\infty\}$. The definitive behavior operator $d : \mathcal{T}_T \to T' \times \{0, \frac{1}{2}, 1\}$ is defined as follows:

- $d(\varphi^{\nu}) = \langle -\infty, 1 \rangle$ if $\varphi^{\nu} \approx 1$.
- $d(\varphi^{\nu}) = \langle -\infty, 0 \rangle$ if $\varphi^{\nu} \approx 0$.

The fact that d is a well defined map is assured by Theorem 6.

Let φ, v be a formula and a temporal assignment over a temporal flow $\langle T, \leq \rangle$, and let $T' = T \cup \{-\infty\}$. The definitive behavior operator $d : \mathcal{T}_T \to T' \times \{0, \frac{1}{2}, 1\}$ is defined as follows:

• $d(\varphi^{\nu}) = \langle -\infty, 1 \rangle$ if $\varphi^{\nu} \approx 1$.

•
$$d(\varphi^{v}) = \langle -\infty, 0 \rangle$$
 if $\varphi^{v} \approx 0$

•
$$d(\varphi^{v}) = \left\langle -\infty, \frac{1}{2} \right\rangle$$
 if $\varphi^{v} \approx \frac{1}{2}$

The fact that d is a well defined map is assured by Theorem 6.

Remark 4.1

The first component of the pairs $\langle t, i \rangle$ indicates the instant of time in which the function φ^{v} assumes the "stable" value: this last one $(0, \frac{1}{2} \text{ or } 1)$ is specified in the second component. This justify the fact that $\langle -\infty, i \rangle$ indicates that the function assumes always the value *i*.

<ロト <四ト < 回ト < 回 > < 回

Let $T' = T \cup \{-\infty\}$. We define a total order relation $\leq_{T''}$, over $T'' = T' \times \{0,1\} \cup \{\langle -\infty, \frac{1}{2} \rangle\}$, as follows: • for each $t, t' \in T$, with t < t', $\langle -\infty, 0 \rangle <_{T''} \langle t, 0 \rangle <_{T''} \langle t', 0 \rangle <_{T''} \langle -\infty, \frac{1}{2} \rangle <_{T''} \langle t', 1 \rangle <_{T''} \langle t, 1 \rangle <_{T''} \langle -\infty, 1 \rangle$.

Now:

メロト メポト メヨト メヨ

For each temporal assignment v (over a temporal flow $\langle T, \leq \rangle$) the function s^{v} : FORM $\rightarrow T''$ has the following behavior:

• $s^{v}(x_{i}) = d(x_{i}^{v}).$

•
$$s^{\nu}(\perp) = \langle -\infty, 0 \rangle.$$

• If
$$s^{v}(\varphi) = \langle a, n \rangle$$
 and $s^{v}(\psi) = \langle b, n' \rangle$, then

$$\begin{split} \mathbf{s}^{\mathbf{v}}(\neg\varphi) &= \langle \mathbf{a}, 1 - \mathbf{n} \rangle \\ \mathbf{s}^{\mathbf{v}}(\varphi \rightarrow \psi) &= \begin{cases} \langle -\infty, 1 \rangle & \text{If } \langle \mathbf{a}, \mathbf{n} \rangle \leq_{T''} \langle \mathbf{b}, \mathbf{n}' \rangle \\ \mathbf{s}^{\mathbf{v}}(\neg\varphi) &\cong \mathbf{s}^{\mathbf{v}}(\psi) & \text{Otherwise} \end{cases} \end{split}$$

Where Υ denotes the maximum over $\leq_{T''}$.

It is immediate to check that

メロト メポト メヨト メヨ

Proposition 4.1

For each formula φ , and temporal assignment v it holds that:

$$s^{\nu}(\neg \neg \varphi) = s^{\nu}(\varphi).$$

The following theorem shows that Theorem 5 and Theorem 15 are equivalent, from the point of view of the "definitive behavior" of an assignment.

Theorem 16

Let v be a temporal assignment. For every formula φ it holds that

$$s^{v}(\varphi) = d(\varphi^{v}).$$

イロト イヨト イヨト イヨ

In this section we show that the temporal semantics previously introduced is complete w.r.t. the logic NM.

Proposition 5.1

Given a temporal flow $\langle T, \leq \rangle$ there is an NM-chain \mathcal{A}_T , with negation fixpoint $\langle -\infty, \frac{1}{2} \rangle$, whose lattice reduct is $\langle T'', \leq_{T''} \rangle$.

Proposition 5.2

Let $\langle T, \leq \rangle$ be a temporal flow and φ be a formula. For every temporal assignment v there is an \mathcal{A}_T -assignment v' such that $s^v(\varphi) = v'(\varphi)$; conversely, for every \mathcal{A}_T -assignment w there is a temporal assignment w' over $\langle T, \leq \rangle$ such that $s^{w'}(\varphi) = w(\varphi)$.

< ロ > < 同 > < 三 > < 三

Theorem 17

Let $\langle T, \leq \rangle$ be a temporal flow. Then, for every formula φ and theory Γ it holds that

$$\Gamma \models_{\mathcal{T}} \varphi \qquad iff \qquad \Gamma \models_{\mathcal{A}_{\mathcal{T}}} \varphi,$$

where $\Gamma \models_T \varphi$ means that for every temporal assignment v such that $s^v(\psi) = \langle -\infty, 1 \rangle$ for every $\psi \in \Gamma$, it holds that $s^v(\varphi) = \langle -\infty, 1 \rangle$.

We finally obtain

Theorem 18 (Completeness theorem)

Let $\langle T, \leq \rangle$ be a temporal flow. Then for each formula φ and finite theory Γ

$$\Gamma \vdash_{NM} \varphi$$
 iff $\Gamma \models_T \varphi$.

Now we conclude by giving some examples of temporal flows connected to interesting NM-chains:

<ロ> (日) (日) (日) (日) (日)

Example 5.1

Let $\langle T, \leq \rangle = \langle \mathbb{N}, \geq_{\mathbb{N}} \rangle$: it follows that $\mathcal{A}_T \simeq NM_{\infty}$. Thanks to ?? we have that, for each formula φ and each finite theory Γ :

$$\Gamma \vdash_{NM} \varphi$$
 iff $\Gamma \models_{\mathcal{A}_{\mathcal{T}}} \varphi$.

Consider now $\langle T, \leq \rangle \in \{\langle \mathbb{R}, \leq_{\mathbb{R}} \rangle, \langle \mathbb{Q}, \leq_{\mathbb{Q}} \rangle\}$: it follows that $\mathcal{A}_T \simeq [0, 1]_{NM}$ or $\mathcal{A}_T \simeq [0, 1]_{NM}^{\mathbb{Q}}$. From Theorems 3 and 17, and with an argument similar to the one given in the proof of \ref{matrix} we have that for each formula φ and theory Γ :

$$\Gamma \vdash_{NM} \varphi$$
 iff $\Gamma \models_{\mathcal{T}} \varphi$.
